Evaluation Rubric - Phase 2

Table 1. *Evaluation Rubric.*

Element	Description
Learning outcome:	Adapt lexical resources and text corpora for text analysis and develop structured programs with Python for raw text
Type of activity:	Independent
Activity score:	120 points
First evaluation criterion: Describe the evaluation criterion. This criterion has a maximum score of: 30 points	High Level: The student performs comprehensive and correct text cleaning and preprocessing over the CISI corpus, including tokenization, case normalization, stopword removal, appropriate handling of punctuation and numbers, and stemming and/or lemmatization. All steps are clearly documented and justified from an NLP perspective. If your work is at this level, you can get between 20 points and 30 points.
	Medium Level: The student applies most of the required preprocessing techniques, but with partial documentation, minor conceptual errors, or inconsistencies in the implementation. If your work is at this level, you can get between 10 points and 19 points.

	Low Level: The student applies only basic or incomplete preprocessing, with important omissions, implementation errors, or a lack of clarity in the description of the process. If your work is at this level, you can get between 1 point and 9 points. Not Submitted: The student does not submit the activity. If your work is at this level, 0 points will be awarded.
Second evaluation criterion: Describe the evaluation criterion. This criterion has a maximum score of: 20 points	High Level: The student clearly implements and compares several text representation techniques (e.g., Bag of Words, n-grams, TF-IDF, and at least one dense representation such as Word2Vec or GloVe), providing a structured comparative analysis table with advantages, limitations, and methodological considerations. If your work is at this level, you can get between 16 points and 20 points. Medium Level: The student implements some of the required representation techniques, but the comparison is limited, incomplete, or lacks depth in the discussion of advantages and limitations. If your work is at this level, you can get between 10 points and 15 points. Low Level: The student presents only one representation technique or an incomplete implementation, with little or no comparative analysis. If your work is at this level, you can get between 1 point and 9 points. Not Submitted: The student does not submit the activity. If your work is at this level, 0 points will be awarded.

Third evaluation criterion: Describe the evaluation criterion. This criterion has a maximum score of: 30 points	High Level: The student correctly implements several supervised models (for example, Logistic Regression, Naïve Bayes, k-NN, Decision Trees, SVM, Random Forests, and/or ensembles) and clearly justifies the selection of algorithms and hyperparameters in relation to the problem and the CISI corpus. If your work is at this level, you can get between 20 points and 30 points. Medium Level: The student applies one or more supervised models with partial justification and a general description of the experimental setup, but with limited depth in the argumentation. If your work is at this level, you can get between 10 points and 19 points. Low Level: The student implements classification models in a limited way, with little or no justification of the chosen algorithms or training procedure. If your work is at this level, you can get between 1 point and 9 points. Not Submitted: The student does not submit the activity. If your work is at this level, 0 points will be awarded.
Fourth evaluation criterion: Describe the evaluation criterion. This criterion has a maximum score of: 30 points	High Level: The student rigorously evaluates the models using appropriate metrics (e.g., accuracy, confusion matrix, precision, recall, F1-score and, if applicable, regression metrics such as R^2 and MSE), and presents a clear comparative analysis of the results, discussing strengths, weaknesses, and patterns observed in the CISI corpus. If your work is at this level, you can get between 20 points and 30 points. Medium Level: The student reports some relevant metrics and

	basic comparisons, but the analysis is partial, mainly descriptive, or lacks critical reflection. If your work is at this level, you can get between 10 points and 19 points. Low Level: The student reports metrics in a superficial or inconsistent way, with little or no comparative discussion of the models. If your work is at this level, you can get between 1 point and 9 points. Not Submitted: The student does not submit the activity. If your work is at this level, 0 points will be awarded.
Fifth evaluation criterion: Describe the evaluation criterion. This criterion has a maximum score of: 10 points	High Level: The student submits the work in the requested article format, with coherent structure, clear academic style at master's level, and correct use of APA standards for in-text citations and references. If your work is at this level, you can get between 9 points and 10 points. Medium Level: The student submits the work but does not fully comply with some of the guidelines (structure, style, or APA format). References are present but partially inconsistent. If your work is at this level, you can get between 7 points and 8 points. Low Level: The student submits the work with important deviations from the requested format, poor writing quality, or major problems in citation and referencing. If your work is at this level, you can get between 1 point and 6 points. Not Submitted: The student does not submit the activity.

	If your work is at this level, 0 points will be awarded.
